AVIGILON JOINT INTEROPERABILITY TEST COMMAND (JITC) CERTIFICATION

Avigilon's Best-in-Class, End-to-End Video Security Solution Achieves JITC Certification

The Avigilon Video Security solution has achieved JITC certification. This certification demonstrates that Avigilon has met the interoperability and cyber testing requirements from a DoD Approved JITC lab. Avigilon is among the first Fixed Video Security surveillance solutions to obtain this certification, allowing U.S. federal government agencies to safely deploy this solution in the most secure information network infrastructures.

The JITC-certified solution includes: Software Release Avigilon Control Center (ACC) with FIPS enabled H5 Series and H4 Multi-Sensor Cameras with Software Release version 7.14x. This ensures it meets the advanced security requirements of the JITC as defined by Unified Capabilities Requirements (UCR) 2013 and administered thorough Risk Management Framework (RMF) criteria through Secure Technical Implementation Guides (STIGs) and Federal Information Processing Standard (FIPS).

JITC Certification

The Joint Interoperability Test Command (JITC) is the Defense Information System Agency's (DISA's) primary agent for testing, evaluating, and certifying Information Technology (IT) and National Security Systems (NSS) used in joint and multi-domain operations. The JITC certification process ensures that a system meets or exceeds the joint interoperability requirements of its users and assures that in mission-critical situations, communications (as well as other systems that are interconnected using the same network) will remain secure and intact. JITC includes testing areas of network security, network interoperability, and system reliability.

Why JITC Matters

JITC testing helps agencies minimize cyber security vulnerabilities and is required to deploy updated hardware and software on DoD base networks and within Intelligence or Federal Civilian networks that adhere to DoD standards. This certification and testing also provides all customers and prospective customers adherence to high standards and requirements in areas of security, availability, and interoperability by a trusted 3rd party resource.
